## Acknowledgement

Special thanks to YJango in Zhihu, his article(in Chinese) in Zhihu provides elegant introduction to CNN. He also produces lots of nice figure which makes CNN to be understood easily and I borrowed some of them in our presentation. I also would like to thank Prof. Lennart Svensson from signal processing group, Chalmers University of Technology for his nice guiding, patient help, wonderful lecturing and discussion when I attended his deep machine learning course in Chalmers. Some of the materials I use in this slide comes from the resource in this course. At last, thanks to the fruitful discussion and help from Dapeng Liu from Zenuity, Xinlin Zhang from Ericsson and Zihui Wang from Chalmers in deep machine learning course, you made good experience for my first course in Chalmers.

# The 11st Book Circle of Python Machine Learning

In this presentation belongs to **algorithm** part of the book

- The context in this circle is NOT included in the book
- If you want to know more about Deep Neural Network, I recommend reading book Deep Learning from Ian Goodfellow, Yoshua Bengio and Aaron Courville
- We will try to go through basic mathematics behind Convolutional Neural Network(CNN), Recurrent Neural Network(time RNN).
- All of us need to debug the python code, in order to get practice of implementing machine learning algorithm
- A complete resources for deep neural network and machine learning could be found here [▶ Link](#)

# Overview

## 1 Convolutional Neural Network: Specialized Kind of Feedforward Network

- Intro to Architecture of CNN in General
- Parameters in CNN: Design Rule in General
- CNN Architecture: Concrete Examples

## 2 Recurrent Neural Network

- Introduce to RNN: (Basic) Standard Architecture
- Sequence Modeling: HMM v.s. RNN
- GRM and LSTM
- Recurrent Attention Model(RAM)

## 3 Conclusion

# Outline for Section 1

## 1 Convolutional Neural Network: Specialized Kind of Feedforward Network

- Intro to Architecture of CNN in General
- Parameters in CNN: Design Rule in General
- CNN Architecture: Concrete Examples

## 2 Recurrent Neural Network

- Introduce to RNN: (Basic) Standard Architecture
- Sequence Modeling: HMM v.s. RNN
- GRM and LSTM
- Recurrent Attention Model(RAM)

## 3 Conclusion

# Convolutional Neural Network

From this slide we introduce Convolutional Neural Network. Here are some comments right before we start

- Actually lots of topics regarding deep learning, e.g. convolutional neural network, have weaker/less connection to perfect/beautiful mathematical expression/derivation. They are more relative to intuitive and heuristic designing, especially on the designing of network architecture/structure. It makes the deep neural network problem does NOT look like algorithm design but more logical and mechanism design (At least it is like that as compared with classical machine learning algorithms, adaptive/statistical signal processing and Bayesian filters)

# Convolutional Neural Network

- So we more or less give up mathematical expression/derivation but go for logical reasoning or logically explanation for convolutional neural network
- An easy understood resource regarding convolutional neural network could refer to Ujjwal Karn's blog "[An Intuitive Explanation of Convolutional Neural Networks](#)" [▶ Link](#)
- A better description of convolutional neural network could be found in [note "Module 2: Convolutional Neural Networks" of Feifei Li's course "Convolutional Neural Networks for Visual Recognition" in Stanford University](#) [▶ Link](#)
- Since these materials have extremely good contents on CNN, I might sometimes just refer to the contents of them directly with denoting

# Convolutional Neural Network

- There are more videos and materials could be good to look at, e.g. [Last lecture of Jianbo Shi's Vision Intelligence and Machine Learning Course at University of Pennsylvania/Edx](#) [▶ Link](#) which talks CNN for machine vision, [Lex Fridman's Deep Learning for Self-Driving Cars at MIT](#) [▶ Link](#) where introduces what is CNN and how the CNN can be designed for self-driving car, and also "[Deep Learning School 2016: Individual Talks](#)" [▶ Link](#) where discusses how the CNN applies for computer vision
- If you still remembered we discussed how many high techniques have been invented in Bell Lab in the SVM section on the 2nd circle of our machine learning presentation, here we have to mention one more important invention, [LeNet](#), the first successful applications of Convolutional Networks were developed by Yann LeCun in 1990s in Bell lab as well!

# Intro CNN for Image Recognition

# Architecture of CNN

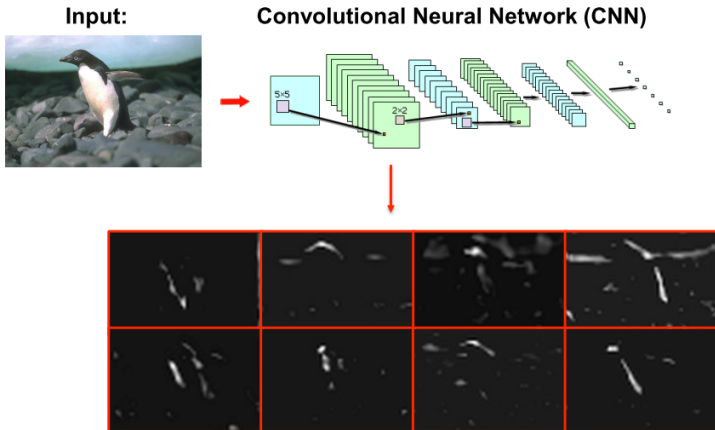

# Architecture of CNN

# Architecture of CNN

- Now, let's borrow 3 pictures from Jianbo Shi's Vision Intelligence and Machine Learning Course at University of Pennsylvania/Edx(See reference) to show/illustrate what are the functionality of neurons in early convolutional layers of CNN, functionality of neurons in deeper/later convolutional layers of CNN, and functionality of different filters on each convolutional layer

# Architecture of CNN

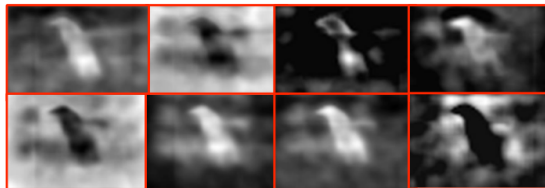

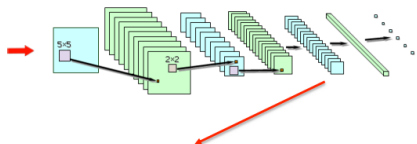

**Early layers learn to detect low level structures such as oriented edges, colors and corners**

# Architecture of CNN

Input:

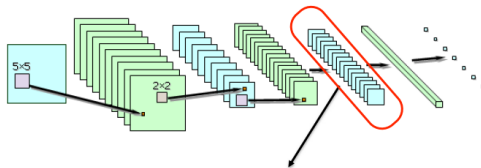

Convolutional Neural Network (CNN)

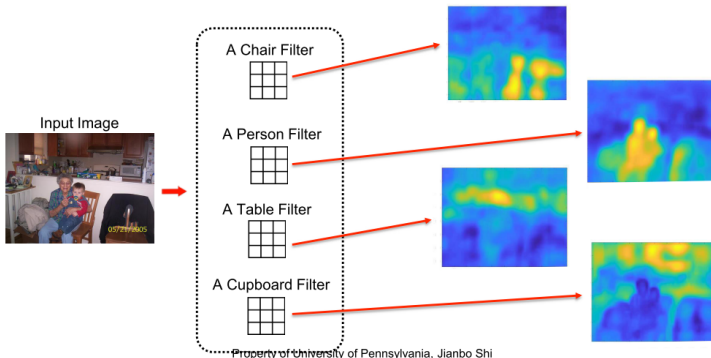

Deep layers learn to detect high-level object structures and their parts.

# Architecture of CNN

A Closer Look inside the Convolutional Layer

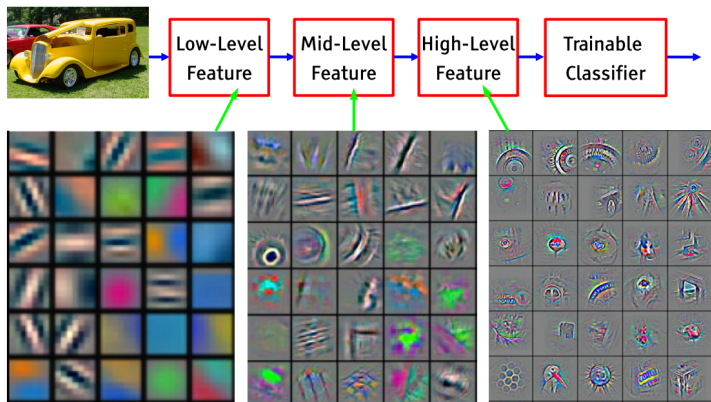

# Architecture of CNN

Another figure from Yann LeCun's deep learning at New York University also shows the same idea

It's deep if it has more than one stage of non-linear feature transformation

Feature visualization of convolutional net trained on ImageNet from [Zeiler & Fergus 2013]

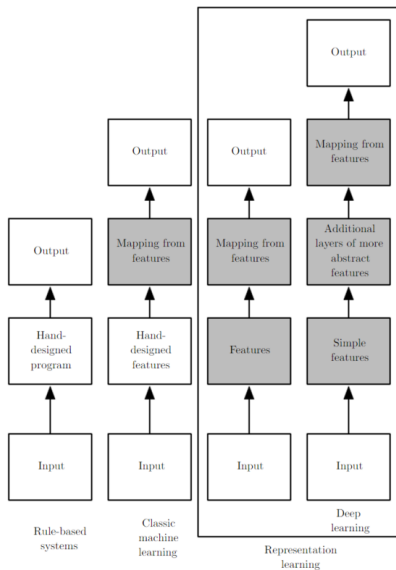

# Architecture of CNN

From the architecture of CNN we noticed the biggest difference between CNN and traditional machine learning algorithms are:

- 1. We leave the feature extraction/selection to machine(Neural Network itself) rather extract features manually
- 2. In CNN we also gather together lower level detailed features/patterns to make high level/abstract/"near to the object" features

We can summarize these differences by using the figure borrowed from Ian Goodfellow Yoshua Bengio, Aaron Courville's book Deep Learning, on next page

# Architecture of CNN

# Architecture of CNN

- Another figure from Yann LeCun's deep learning at New York University also shows the same idea regarding the difference between traditional ML and deep learning

## Traditional Pattern Recognition: Fixed/Handcrafted Feature Extractor

## Mainstream Modern Pattern Recognition: Unsupervised mid-level features

## Deep Learning: Representations are hierarchical and trained

# Parameters in CNN: Design Rule in General

# CNN Architecture: Concrete Examples

# Outline for Section 2

## 1 Convolutional Neural Network: Specialized Kind of Feedforward Network

- Intro to Architecture of CNN in General
- Parameters in CNN: Design Rule in General
- CNN Architecture: Concrete Examples

## 2 Recurrent Neural Network

- Introduce to RNN: (Basic) Standard Architecture
- Sequence Modeling: HMM v.s. RNN
- GRM and LSTM
- Recurrent Attention Model(RAM)

## 3 Conclusion

# Recurrent Neural Network

# Recall Hidden Markov Model and Kalman Filter

# HMM Architecture v.s. RNN Architecture

## Note

```
1: Initialize the all elements  $w_d$  in weight  $\mathbf{w}$  to 0
2: for  $t$  in  $T$  do
3:     Shuffle(); // randomly sort the  $L$  samples once
4:     for  $l$  in  $L$  do
5:         for  $d$  in  $D$  do
6:             computer  $w_d(t+1) = w_d(t) + \eta(t)(y^{(l)} - \mathbf{x}^{(l)}\mathbf{w})x_d^{(l)}$ 
7:              $d = d + 1$ 
8:         end for
9:          $l = l + 1$ 
10:    end for
11:     $t = t + 1$ 
12: end for
```

- $\eta(t)$  means  $\eta$  is a function of  $t$

# Outline for Section 3
